Based in Lymington, Scorpion Vision specialise in image processing software, specifically machine vision. The vision software is the foundation of the business but as a natural extension to this they also supply digital industrial cameras for a broad range of applications.

SCORPION
VISION SOFTWARE®

This Machine vision software is most commonly used to improve manufacturing quality. It benefits the customers in a number of ways. The first is with the reduction of labour costs as it reduces the reliance on manual intervention. The second most important factor is 100% quality control 100% of the time. Other benefits are the ability to increase throughput speed/volume without any negative effects on production.

Scorpion are market leaders in the field of 3D machine vision and are working hard to dominate that space. The plan involves partnering with the major robotics manufacturers in the UK as well as the larger automation builders who typically have a requirement for this technology.

They carry out customer training and support using web technologies. The customer base is spread throughout the UK and further afield.

Much of the customer support and intervention is carried out directly from the offices in Lymington using broadband remote connections.

As well as a fully developed online store selling a wide selection of products, the company has also made use of Twitter to further promote their range.
